Study of the Effects of Reducing Inflammation on Your Heart Health

Researchers at the University of Kentucky, along with CIRT (Cardiovascular Inflammation Reduction Trial), are inviting you to participate in a study that will examine if a new study drug will reduce inflammation and decrease the risk for heart attacks, strokes, and death.

You may be eligible to participate if you:

- Have had a heart attack or coronary artery stents
- Have a history of type 2 diabetes or metabolic syndrome

Each study visit will take 20 minutes to an hour. Visits will be at the doctor’s office or by phone, depending on how long the drug has been taken.
