Did you know that about 1 in 3 people with epilepsy who take antiepileptic drug(s) still have seizures? Others may have seizures under control, but have unwanted side effects. New drugs to control seizures are still needed. This can only happen through participation in clinical research trials.

If you have uncontrolled partial-onset seizures, consider joining a clinical research study. This clinical study will determine if an investigational drug is effective when taken with the drug(s) you are already taking. The risks and benefits will be fully explained to you prior to your entering the study. There is a one in four possibility that you will receive placebo (dummy pill) versus study drug.

You may qualify if you:
• Are between 18 and 70 years of age
• Were diagnosed with epilepsy and are able to provide documentation of your diagnosis
• Are currently taking one, two, or three antiepileptic drugs
• Have had at least 8 partial-onset seizures in the past 8 weeks
• Are willing to document your seizures on a daily basis

If you qualify, participation includes:
• Visits to the clinic every 2-4 weeks for up to 31 weeks
• Ability to withdraw from participation at any time
• Option to participate in the open-label part of the research trial for 1 year or more (you will know what dosage of study drug you are taking)

If you qualify, you will receive at no cost to you:
• Study-related care from the study team
• Study-related exams and tests, with monitoring of seizures and overall health status
• Study-drug throughout your participation in the clinical research trial

Important information: If you qualify for the study, you may participate at no cost to you, even if you do not have insurance or if the clinical trial doctor is outside of your plan’s network.
